Expert opinion

Activity of Desi Lux against modified vaccinia virus Ankara (MVA) in a quantitative suspension test according to EN 14476:2013+A2:2019 under clean conditions.

This expert opinion is based on the test report L20/0809MV.1 dating 18/08/2020.

The virus-inactivating properties of the hand disinfectant Desi Lux against modified vaccinia virus Ankara (MVA) were investigated by a quantitative suspension test according to EN 14476:2013+A2:2019 under clean conditions.

According to the EN 14476, a disinfectant or a disinfectant solution at a particular concentration is considered as having virus-inactivating properties if within the recommended exposure period the titre is reduced by $\geq 4 \log_{10}$ (inactivation $\geq 99.99\%$).

The hand disinfectant Desi Lux was examined undiluted at 20 °C. 30 seconds were chosen as exposure time. In summary, a virucidal activity against modified vaccinia virus Ankara (MVA) was measured as follows:

undiluted 30 seconds clean conditions (0.3 g/l BSA)
